

The best solution for wood protection

Important Information: CUTEK® EXTREME and Dimensional Stability

The images below demonstrate the exceptional long term dimensional stability that CUTEK® EXTREME imparts to wood.

Picture 1.

Thermally treated Southern Yellow Pine six weeks after the piece was cut in half, and one side (left) was dipped once in clear CUTEK® EXTREME. The picture shows swelling and fading in the un-coated portion. These pieces were both left in full sun and rain exposure

Picture 2.

The same pieces of Southern Yellow Pine as Picture 1, after 12 months exposure. The CUTEK® EXTREME coated piece has faded to a natural wood look but has not greyed or changed in size. The uncoated piece has swelled, split and gone grey.

Picture 1.

Several species of lumber which were dip coated once in CUTEK® EXTREME (one end of the board only). The other end was left un-coated. This picture of the dipped ends was taken 12 months after coating.

Picture 2.

The same pieces of lumber as in Picture 3, showing the uncoated ends, after 12 months of full sun and rain exposure.
