

The best solution for wood protection

## Important Information: **Cutek and Dimensional Stability**

The images below demonstrate the exceptional long term dimensional stability that **Cutek** products impart to wood.

**Picture 1.** Thermally treated Southern Yellow Pine six weeks after the piece was cut in half, and one side (left) was dipped once in clear **CUTEK™EXTREME**. The picture shows swelling and fading in the uncoated portion. These pieces were both left in full sun and rain exposure

**Picture 2** The same pieces of Southern Yellow Pine as Picture 1, after 12 months exposure. The **CUTEK™EXTREME** coated piece has faded to a natural wood look but has not greyed or changed in size. The uncoated piece has swelled, split and gone grey.

**Picture 3** Several species of lumber which were dip coated once in **CUTEK™EXTREME** (one end of the board only). The other end was left uncoated. This picture of the dipped ends was taken 12 months after coating.

**Picture 4** The same pieces of lumber as in Picture 3, showing the uncoated ends, after 12 months of full sun and rain exposure.
